"The Movement of a Sphere in a Viscous-Plastic Liquid Disperse System"
Tr. Kazansk. Khim.-Tekhnol. In-ta, No 17, 1953, 84-93

The movement of a sphere in a viscous -plastic disperse system does not follow stoke's law. By using the approximation method of integrating general equations for the flow of viscous-plastic mediums, a sufficiently accurate equation for a falling sphere was derived. This equation makes it possible to determine the rheological constants of viscous-plastic disperse systems from observation of a falling sphere. A rule governing the movement of a sphere in a viscous liquid can be derived from this equation as a special case. (RZhKhim, No 3, 1955)

Tyabin, N. V., and Pudovkin, M. A. The flow of a viscous-plastic dispersive system in a conical diffuser. Doklady Akad. Nauk SSSR (N.S.) 92, 53-56 (1953). (Russian)

Les auteurs étudient l'écoulement d'un milieu dispersif, doué de viscosité plastique, dans un diffuseur conique. Le phénomène est régi par les équations écrites par Tyabin; celles-ci sont simplifiées, dans le cas particulier considéré, en utilisant les conclusions expérimentales de la thèse de Mme Lazovsky; en particulier les déplacements peuvent être considérés comme radiaux. Les auteurs tiennent compte

de ces faits pour former les expressions approchées des solutions des équations de Tyabin; les formules résolitives sont assez simples pour permettre une discussion détaillée de toutes les particularités du phénomène. Entre autres résultats,

les auteurs donnent la loi du débit total en fonction de la pression; la relation qu'ils obtiennent est linéaire et paraît en bon accord avec l'expérience pour de grandes pressions.

"Irregular Flow of a Viscous-Plastic Dispersed System in the Layer Between Two Coaxial Cylinders and That in a Cylindrical Tube," by N. V. Tyabin, Tr Kazansk. s.-kh. in-ta, 1957, Issue 35, pp 213-225 (from Referativnyy Zhurnal -- Mekhanika, No 2, Mar 57, Abstract No 3120, by N. A. Slezkin)

"In the first part, the problems of the circular flow of a viscous-plastic medium (taking into account the limiting shear stresses) and its rectilinear motion between the two coaxial cylinders are studied. In both cases the differential equations of motion of the inner cylinder and of the medium are calculated jointly, taking into consideration the local derivative of time in respect to the average velocity (N. A. Slezkin, S. M. Targ, Dokl. AN SSSR, 1946, 54, No 3). The third part considers the problem of the irregular flow of a viscous-plastic medium in a circular cylindrical tube with the assistance of an average calculation of acceleration ('Approximate Solution of the Problem of the Irregular Motion of a Viscous-Plastic Fluid in a Circular Cylindrical Tube,' by A. Kh. Mirzadzhanzade and A. A. Abbasov, Dokl. An SSSR, Vol 107, No 2, 1956, pp 249-251). A comparison is made between the computed curve of the changing moments of friction forces and the experimental curve. In the 'starting period' there is a considerable divergence of the curves." (U)

Title : Theory of anomalous viscosity of dispersive systems

Periodical : Zhur. tekhn. fiz., 25, February 1955, 339-350

Abstract : One of the central problems concerning the flow of dispersive systems is the problem of anomalous viscosity, first discovered in connection with the anomalous rheological properties of sols and gels by the Russian scientist F. Schwedoff (J. de Phys. theor. et appl., 1889) and fully discussed by the present writer (Kolloidn. zhurn., 11, 6, 438, 1949). In the present work he attempts to create a phenomenological theory of flow of nonelastic anomalously viscous dispersive systems by preceeding from an analysis of the experimental dependence of velocity gradient upon tangential displacement stress, and does not touch on the nature of the anomaly of viscosity of dispersive systems. The author thanks Professor G. V. Vinogradov, early investigator of anomalous viscous properties of consistent lubricants in a wide range of velocity gradients (Trudy vt. konf. po treniyu i iznosu v mashinakh [Works on 2nd Conference on Friction and Wear in Machines], 3, 311, 1949). TITLE:

Lubricant outflow through labyrinth packings

PERIODICAL:

Referativnyy zhurnal. Khimiya, no. 17, 1961, 475, abstract
17M238 (Tr. 3-y Vses. konferentsii po treniyu i iznosu v
mashinakh. M., AN SSSR, v. 3, 1960, 154-163)

TEXT: A theoretical and experimental study was made of the outflow of oils and plastic lubricants through labyrinth packings forming different combinations of cylindrical coaxial slits and spaces between plane disks. It was shown that the resistance against axial flow in a cylindrical slit, under equal hydrodynamic conditions, is twice as large as in a radial flow in a plane clearance. The experimental arrangement constituted the model of a caterpillar drum. The lubricant outflow in the drum took place at a given temperature and pressure, both with fixed and with rotating bearing: 100 - 800 rpm. The area of the labyrinth packing inlet cross section exerts a decisive effect upon the properties of hermetically sealing. The outflow of liquid oils and kerosene is independent of the labyrinth packing

Card 1/2

Lubricant outflow through...

rotation. The outflow of plastic lubricants is significantly increased as the drum bushing is set in rotation. The lubricant outflow grows on a diminution of viscosity (η), and in case of plastic lubricants also on a diminution of the ultimate strength (θ). Theoretically, consumption is determined from the following formula:

$$q_{\text{theor.}} = 0.5 \cdot \pi (R_2 - R_1)^2 \cdot R_1 \cdot \eta^{-1} [0.33 (R_2 - R_1) l^{-1} \Delta P - \theta]$$

R_1 = inner radius, R_2 = outer radius, l = length of ring slot; P = pressure drop in the labyrinth packing. [Abstracter's note: Complete translation.]

TITLE: Flow of Anomalously Viscous Bodies Under Complex Stress
Conditions

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh
nauk Mekhanika i mashinostroyeniye, 1960, Nr 2,
pp 65-69 (USSR)

ABSTRACT: A continuation of previous work (Refs 5, 6, and 7). Data are given of experimental investigations into the flow of a residual extract (highly viscous Newtonian fluid) and a lubricant grease (anomalously viscous body) to verify the generalized flow law under the combined action of two simple shears. The data were obtained by simultaneous measurements with a double rotation viscometer (Ref 6) and a capillary viscometer with constant outflow (Ref 7). The methods and basic experimental results are given in Ref 5. Complex shear conditions were realised by the combined action on the body contained in the space between two cylinders, of an external pressure and a twisting moment, the latter being obtained by rotation of the outer cylinder. In this way, axial

Card 1/5

Flow of Anomalous Viscous Bodies Under Complex Stress Conditions

and circumferential flow are superimposed and the particles of the anomalously viscous body move in screw trajectories ab (Fig 1: Scheme of screw flow of grease in a narrow annular space). The generalized equation of flow is written in the form (1) (Ref 8), and in cylindrical co-ordinates r, φ, z , the quantities p_i and \dot{e}_i are written in the forms (2) and (3). (The dot over e_i denotes differentiation with respect to time). p_i is the intensity of shear stress, \dot{e}_i the intensity of deformation velocity, η_i the effective viscosity coefficient, $p_{rr}, p_{\varphi\varphi}, p_{zz}$ are normal stresses, $\dot{e}_{rr}, \dot{e}_{\varphi\varphi}, \dot{e}_{zz}$ are volume deformation velocities, $\dot{e}_{r\varphi}, \dot{e}_{\varphi z}, \dot{e}_{zr}$ are shear deformation velocities. For the present conditions, (2) and (3) reduce to (4) and (5) with the effective viscosity in complex shear, axial shear and circumferential shear given by (6), (7) and (8), respectively. The shear stresses for pure-axial shear τ_1 and pure circumferential shear τ_2 are given by the first equations, p 67, where Δp is the difference in pressure between the ends of the annular space,

Card 2/5

S/179/60/000/02/009/032
E081/E241

Flow of Anomalous Viscous Bodies Under Complex Stress Conditions

H and L are the width and length of the space, M is the twisting moment, R_1 and R_2 are respectively the external and internal radii of the cylinders ($H = R_1 - R_2$). The mean deformation velocities in axial shear D_{10} and circumferential shear D_2 are found from the second equation, p 67, and the axial deformation velocity at the wall from the third equation, where Q is the outflow per second, ω the angular velocity of the rotor. Figs 2 and 3 show $\log \eta_1$, $\log \eta_2$ and $\log \eta_1$ plotted against $\log D_1$, $\log D_2$ and $\log D_1$ for the extract. [Fig 2. Dependence of effective viscosity (axial, circumferential and spiral flow) on velocity gradient and intensity of deformation velocity for the extract] and for the grease [Fig 3. Dependence of effective viscosity (axial, circumferential and spiral flow) on velocity gradient and intensity of deformation velocity for lubricant grease]. The key to the figures on the diagrams is at the foot of p 67. In Fig 3 $\eta_1(D_1)$ is represented by the dashed-dotted line, $\eta_2(D_2)$ by the continuous line and $\eta_1(D_1)$ by the dotted line. The lines in Fig 2 are all parallel to the $\log D$

Card 3/5

S/179/60/000/02/009/032
E081/E241

Flow of Anomalously Viscous Bodies Under Complex Stress Conditions

axis, and, for a given temperature, the points corresponding to different conditions all lie on the same line. Thus the effective viscosity of the residual extract is constant, and the superposition principle applies. Fig 3 shows that the effective viscosity of the lubricant grease falls with increasing deformation velocity. At 20° and 50° the effective viscosity for axial shear is rather greater than for circumferential shear. The differences may be interpreted as a breaking down of the structure of the grease and the orientation of the soap micro-filaments. The motion of the particles in spiral flow is determined by the equations at the foot of p 68 and the top of p 69, and Fig 4 shows the dimensionless viscosity η_1/η_2 plotted against the dimensionless length of the trajectory. [Fig 4 Dependence of the dimensionless viscosity η_1/η_2 on S/L for grease at 20° and 50°] Within the limits of experimental accuracy (5 to 10%) the points lie on the same line for both temperatures, and the effective viscosity is a function not only of the intensity of

AUTHORS: Yerofeyev, A. A., Tyabin, N. V.

TITLE: Intermixture of Viscous-plastic Disperse Systems by the Aid of Agitators

PERIODICAL: Khimicheskaya promyshlennost', 1959, Nr 5, pp 436-441 (USSR)

ABSTRACT: The process of intermixture of viscous-plastic fluids is illustrated according to the theory of resemblance (Refs 5,6). The calculations for the purpose of generalizing experimental data and calculating the necessary capacity for intermixture of viscous-plastic fluids, base on the equation $Eu_M = KRe_M^m$ (14) (Eu_M = Euler-criterion, Re_M = Reynolds criterion, K = coefficient, m = experimental value, the index M means the generalization of resemblance criterions for viscous and viscous-plastic fluids). The criterion of boundaries was laid down (being characteristic in the region, in which the fluid starts to flow with increasing velocity), and measurements were made by a testing arrangement (Fig 1) with 6 different agitators of the frame type and with 3 agitators of the turbine type (Fig 2). One of the agitator types is used in Kazanskiy neftemaslozavod

Card 1/2

SOV/64-59-5-18/28

Intermixture of Viscous-plastic Disperse Systems by the Aid of Agitators

(Kazan' Oil Plant). The single agitators exhibit different sizes in relation to each other (Table 1). The intimate mixture of synthetic (lubricating) greases US_g-2 and of petroleum mixtures was investigated by means of a rotation-viscosimeter RV-8. The functions between the Euler and Reynolds criterions were obtained for every used agitator by generalizing the experimental data according to methods of the theory of similarity (Fig 6, Table 2). The method of calculating the capacity, that is necessary for intermixture of viscous-plastic fluids, is suggested on the strength of results obtained. The shape of the free surface in the agitator vessel as well as the criterion of the boundaries are of no special importance to the agitator capacity required. There are 2 figures, 6 tables, and 7 references, 5 of which are Soviet.

PERIODICAL: Tr. Kazansk. s-kh. in-ta, 1956, Nr 35, pp 213-225

ABSTRACT: In the first problem the author analyzes the circular motion of a visco-plastic medium (with the yield stress in shear taken into consideration); in the second problem, its rectilinear motion between two coaxial cylinders. In either case the author solves simultaneously the differential equation of motion of the inner cylinder and the differential equation of motion of the medium with the local time derivative of the velocity taken in an averaged form (Slezkin, N. A., Targ, S. M., Dokl. AN SSSR, 1946, Vol 54, Nr 3). In the third problem the unsteady flow of a visco-plastic medium in a round cylindrical pipe is likewise studied with an averaged value

Unsteady Flows of a Visco-plastic Disperse System in a Layer (cont.)

taken for the acceleration (see RZhMekh, 1957, Nr 3, abstract 119). A comparison is adduced between the design graph of the variation with time of the friction-force moment and experimental measurements. A considerable divergence between the above-mentioned graphs occurs in the "starting-up-period" sector.

TITLE: The Application of the Similarity Theory in Calculating the Flowing Processes of Plastic Lubricants in Tubes (Primeneniye teorii podobiya k raschetu protsessov techeniya plastichnykh smazok v trubakh)

PERIODICAL: Kolloidnyy zhurnal, 1959, Nr 2, pp 208-215 (USSR)

ABSTRACT: The authors propose two methods of generalizing experimental data, and the calculation of the flow of plastic lubricants in tubes in the form of a dependency of the tube resistance coefficient on the generalized Reynolds criterium. The variable effective viscosity method consists in the determination of the generalized Reynolds criterium according to the value of the local effective viscosity for the layer contiguous to the tube wall. The constant parameter method consists in the approximation of the flow curve in the form of straight lines corresponding to the equations Shvedov-Bingham and in the determination of the generalized Reynolds criterium according to the parameters of the viscous-plastic

The Application of the Similarity Theory in Calculating the Flowing Processes of Plastic Lubricants in Tubes

flow. The application of these methods permitted a generalization of experimental data concerning the flow of plastic lubricants in tubes at a change of the speed gradient from 0.03 to 35,400 sec.⁻¹, the length of the tubes by 250 times and their diameters by 36 times. The authors have found an expression of the tube resistance coefficient from the generalized Reynolds formula at the flow of plastic lubricants, and have shown that for the calculation of loss of pressure, the usual hydraulic calculation methods can be used. These are based on the method of approximating curves of the flow of plastic lubricants in rotary viscosimeters. The authors mention the following Soviet scientists: G.V. Vinogradov, V.P. Pavlov, V.G. Petrovskiy, N.V. Tyabin. There are 5 graphs and 21 references, 12 of which are Soviet and 9 English. (Chemical-Technological Institute imeni S.M. Kirova, Kazan') May 6, 1958

Title : Application of Approximation Method to Computation of
Dispersion System Flows.

Orig Pub: Kolloidn. zh., 1957, 19, No 4, 505-510.

Abstract: The necessity to evaluate concrete values of maximum tangential stresses and velocity gradients at the approximation of flow curves of dispersion systems was shown on the example of flows of plastic lubricants in plain bearings and of bitumens along inclined planes. An expression was obtained for the rotation moment depending on the angular velocity of rotation at the flow of a plastic dispersion system in the ring-shaped clearance between coaxial cylinders, if the flow curve could be approximated with n equations of Shvedov-

Title: Sinking of a Flat Wedge in Lubricant Grease

Original

Periodical: Tr. Kazan. khim.-tekhnol. in-ta, 1954, No 18, 222-229

Abstract: Results of investigations of kinematics and dynamics of sinking of
a wedge in lubricant greases. Derived is the law of velocity dis-
tribution during sinking of the wedge and an equation that corre-
lates kinematic and dynamic quantities on stationary sinking of
immersed wedge into the lubricant.

TITLE: The Determination of Cobalt and Cadmium in Nickel of High Purity
(Opredeleniye kobal'ta i kadmiya v nikelе vysokoy chistoty)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 3, pp. 262-264 (USSR)

ABSTRACT: This method of determining cobalt is based upon a suggestion made by V. P. Zhivopistsev [Refs. 1,2], according to which cobalt together with diantipyryl-methane and ammonium thiocyanate gives a light blue precipitation which is soluble in concentrated ammonia. From the precipitation the cobalt is colorimetrized with nitroso R-salt. Precipitation is carried out in the medium of sulfuric acid, the deposit is distinctly soluble in hot water, and must be washed with 1% ammonium thiocyanate solution. The process of analysis and the results obtained when determining cobalt (0.0002% Co) are given. Determination of cadmium is carried out by a modified method, also developed by Zhivopistsev [Ref. 4] by precipitation with diantipyryl-methane in the presence of bromide- or iodide ions. In this way it is possible to determine

The Determination of Cobalt and Cadmium in Nickel
of High Purity

32-3-2/52

0.0001 - 0.1% cadmium in nickel, potassium iodide being used in the case of low percentages, because it forms complexes which are not so easily soluble. If copper is present, it must be removed by precipitation with thiosulfate; after combustion of organic substances cadmium is determined polarographically. An exact process of analysis as well as a table of results obtained by the suggested and by two other methods is given. There are 2 tables and 5 references, 4 of which are Slavic.

"Some Peculiarities of the Interaction of Electron with Lattice in Ionic Crystals," S.V. Tyablikov

"Iz Ak Nauk SSSR, Ser Fiz" Vol XVI, No 2, p 232

Brief contents of a report. Eigenfunctions and eigenvalues of the energy of an electron interacting with polarizing waves are found in approximation of strong and weak bonds. In the case of weak bond the dependence of effective mass and fluctuating radius of polaron on temp is found.

The addn to mutual energy of 2 electrons, produced by their interaction with the phonon field, is computed. In the case of strong bond, results for energy and effective mass of polaron are obtained.

✓ Tyabl'kov, S. V. Questions of invariance under translation
in the theory of adiabatic approximation. Ukrain. Mat.
Zhurnal 5, 152-158 (1953). (Russian)

A quantum-mechanical system with internal degrees of
freedom is bound to a fixed centre by an external force. As

the strength of the external force tends to zero, the system
will in the limit become free and acquire the property of
being invariant under translations. The quantum-mechan-
ical description of this limiting process is worked out in
detail. The purpose of the paper seems to be mainly
pedagogical.
